Simplify

$$5^{-2} \times 100^{0.5}$$

A group of students were asked to complete a puzzle.
The histogram shows the distribution of the times taken.

Work out how many students took between 50 and 70 seconds to complete the puzzle.

Calculate an estimate of the number of students who took under 30 seconds to complete the puzzle.

The time taken, t seconds, that it takes a water heater to boil water is inversely proportional to the power, p watts, of the water heater.

When $P = 2000\text{W}$, $T = 252$ seconds.

Find the time it takes to boil water when $P = 800\text{W}$

Expand $2\sqrt{3}(3\sqrt{2} + \sqrt{3})$
