Use factor theorem to show that  
 $(x - 4)$  is a factor of  $x^3 + x^2 - 20x$

$$\text{Let } f(x) = x^3 + x^2 - 20x$$

$$f(4) = 64 + 16 - 80 \\ = 0$$

$\therefore (x - 4)$  is a factor.

Solve the simultaneous equations

$$2x + 4y - z = 15 \quad \text{--- (1)}$$

$$3x + 8y + z = 44 \quad \text{--- (2)}$$

$$x + 2y + 2z = 15 \quad \text{--- (3)}$$

$$\text{(1) + (2)} \quad 5x + 12y = 59 \quad \text{--- (4)}$$

$$\text{(3) + 2x(1)} \quad 5x + 10y = 45 \quad \text{--- (5)}$$

$$\text{(5) - (4)} = -2y = -14 \\ \boxed{y = 7}$$

$$4x + 8y - 2z = 30 \\ \text{add } x + 2y + 2z = 15 \\ \hline 5x + 10y = 45$$

$$\text{sub } y = 7 \text{ into (5)}$$

$$5x + 70 = 45$$

$$5x = -25$$

$$\boxed{x = -5}$$

$$\text{sub } x = -5, y = 7 \text{ into (1)}$$

$$-10 + 28 - z = 15$$

$$-z = -3 \quad \boxed{z = 3}$$

A curve has equation  $y = x^2 + 2x$

Find the gradient of the normal to the  
 curve at the point  $(1, 3)$

$$\frac{dy}{dx} = 2x + 2$$

$$x = 1 \quad \frac{dy}{dx} = 4$$

$$\text{gradient of normal} = -\frac{1}{4}$$

A circle has equation  
 $(x + 7)^2 + (y - 6)^2 = 49$

Is the point  $(-4, 12)$  inside or outside  
 the circle?

Centre  $(-7, 6)$

radius is 7

$$\sqrt{3^2 + 6^2} = \sqrt{45}$$

$$\sqrt{45} < 7$$

$\therefore$  inside circle
